IN THE MATTER OF

NORWOODS Epitomie,

Being the Application of the Doctrine of Triangles, in the two principal kinds of Sayling.

Y intent was here to have annexed a Treatise of Navigation, and especially of such Points therein, as have reference to the whole Doctrine of plain and Spherical Triangles; But I have here shewed the resolution of all useful Problemes, touching the two principal kindes of Sayling by right-

lined Triangles.

Questions of Sayling by the plain or ordinary Sea-Chart.

Although the ground of the Projection of the ordinary Sea-Chart being false, (as supposing the Earth and Sea to be a plain Superficies) and so the conclusions thence derived must also for the most part be erroneous; yet because it is most easie, and much used, and the errors in small distances not so evident, we will not wholly neglect it.

Quest. 1.

Sayling 100 leagues upon the sixth Rumb; how much shall I alter my Parallel or Latitude?

Note. The angle that any Point of the Compass makes with the Meridian, we call the Rumb; but the angle that it makes with any Parallel, we call the complement of the Rumb.

And forasmuch as to every point of the Compass there answers 11 deg. 15 min. therefore the sixth Rumb from the Meridian (namely, E s e, E s e, W s w, or W s w) makes an an-

Problemes of Sailing

gle therewith of 67 deg. 36 min.
whole complement 22 deg. 30 min.
is the angle of the same Rumb
with every Parallel.

Now admit I sail from *D* to *A*,
East North-east 100 leagues, I de-
mand the difference of Latitude
B D.

By the third Case of plain Triangles.

As Radius.

To the distance run,	<i>A D</i> 100 leagues.	2,00000
So sine complem. the Rumb, s <i>A</i> 22 deg. 30 min.		9,58284
To the difference of Latitude, <i>D B</i> 38 $\frac{2}{10}$ leagues.		1,58284

In like manner you may finde the difference of Latitude, for
any distance run upon any other point of the Compass.

2 *Sailing 100 leagues upon the sixth Rumb: how far
am I departed from the Meridian of the place from
which I came.*

That is by the same things given as before, I demand *A B*.

By the third Case of plain Triangles.

As Radius

To the distance run,	<i>A D</i> 100 leagues,	2,00000
So is the sine of the Rumb, s <i>D</i> 67 deg. 30 min.		9,96562
To the departure from the Merid. <i>A B</i> 92 $\frac{4}{10}$ leagues,		1,96562

3 *Sailing upon the sixth Rumb till I alter my Lat-
itude one degree, I demand how far I have sailed?*

As sailing from *D* to *A*, East Northeast, till the difference of
Latitude *D B* be 20 leagues, I demand the distance run *A D*.

Say

by the plain Sea-Chart.

Say by the second Case of plain Triangles.

As sine complement the rumb, $s A 22^{\circ} d. 30 \text{ min. co. ar.}$ 0,41716

To the difference of Latitude DB 20 leagues, 1,30103

So is Radius

To the distance run AD $52 \frac{3}{10}$ leagues 1,71819

The like question might be moved by the departure from the Meridian given,

4. *Sailing upon the sixth Rumb, till I have altered my Latitude one degree: how much am I departed from my first Meridian?*

As sailing from D to A, East North-east, till the difference of Latitude DB be 20 leagues, I demand AB, my departure from the Meridian, (as for example in the former type?)

By the first Case of plain Triangles.

As Radius

To the difference of Latitude, DB 20 leagues, 1,30103

So is the tangent of the rumb, $t D 67^{\circ} \text{ deg. } 30 \text{ min.}$ 10,38278

To the departure from the Merid, AB $38 \frac{3}{10}$ leag. 1,68381

In like manner by the departure from the Meridian given, you might finde the difference of Latitude.

5. *Sailing upon some Rumb, between the North and the East $52 \frac{3}{10}$ leagues, and finding that I have altered my Latitude one degree: I demand upon what point I have sailed?*

As if I sail from D to A, (being some Rumb between the East and North) $52 \frac{3}{10}$ leagues; and then finde the difference of Latitude DB, to be 20 leagues; I demand the angle ADB.

Say by the sixth Case.

As the distance run, DA $52 \frac{3}{10}$ leagues, *co. ar.* 8,28191

Is to Radius,

A 3

So

Problemes of Sayling

So is the difference of Latitude DB 2 leagues, 9,30103

To find complement the Rumb, $\angle A$, 22 deg. 30 min, 9,58294

Whole complement D, 67 deg. 30 min, is the sixth Point from the Meridian, namely, East Northeast. Here we neglect some part of a minute (as in these things not to be regarded) and so in other places.

6. *Sayling upon some Rumb between the North and the East 52 $\frac{1}{2}$ leagues, and finding that I have altered my Latitude one degree: I would know my departure from my first Meridian?*

By the seventh Case.

To the distance run, add the difference of Latitude, and also substra \bar{c} t it from the same, noting the Sum and Remainder. Then add together the Logarithmes of this Sum and Remainder, and half that Total is the Logarithme of the distance from the first Meridian.

Distance run D A, 52 $\frac{1}{2}$ leag.	}	Summe 72 $\frac{3}{8}$ leag.	1,85884
Differ. of latid. D B, 20 leag.	}	Remain. 32 $\frac{1}{8}$ leag.	1,50853
			3,36737

Departure from the Meridian AB, 48 $\frac{3}{8}$ leagues. 1,68368

The same may be otherwise found by the same case.

And in like sort might the difference of Latitude be found, the departure from the Meridian being known.

7. *The distance of the Meridians of two places, and the difference of the Latitudes of the same places being given: to finde the Rumb and distance?*

As let A represent the Lizard in the west part of England, and AB the Parallel thereof, and let D represent St. Maries Island being one of the Azores, DB, the Meridian thereof.

Then

Then is AB the distance of the Lizard, from the Meridian of *St. Maries*, which let be 222 leagues; and AB , the distance of their parallels, or difference of their latitudes 256 leagues, I demand the rumbe, namely, the angle at D , and the distance in the rumbe AD .

First, for the rumbe, say by the fourth case.

As the difference of Latitude DB 256 leagues, *co. ar.* 7,59176
Is in proportion to Radius;
So is the distance of the meridian AB , 272 leagues, 2,43457
To the tangent of the rumbe D , 46 deg. 44 min. 10,02633
Which is the fourth Rumbe from the meridian, and 1 deg. 44 min. more; which shews the course from *St. Maries* to the Lizard, to be Northeast, 1 deg. 44 min. Easterly: or from the Lizard to *St. Maries* Southwest, 1 deg. 44 min. Westerly. And thus it should be by the plain Chart.

Secondly, for the distance AD ; say by the 2 case.

As the sine of the rumbe, D 46 deg. 44. min. *co. ar.* 0,13776
To the distance of the meridians AB , 272 leagues, 2,43457
So is the Radius
To the distance of the places AD , 373½ leagues, 2,5733
And such should be the distance by the plain Chart.

8. *Sayling away W S W, I see a point of Land, which I see, and finde to bear from me West by North, and having sayled six leagues further, I finde it bears from me Northwest by West: I would know how far it is distant,*

Problemes of Sailing

As let E be a point of land, which when the ship is at A, I set and finde to bear from West by North, but I hold on my course from A to D, West South West 18

miles, and at D, I set the same point of Land again, and finde it to bear from me North-west by West: I demand the distance thereof D E, that is, how far it was from me in my last obseruation?

First, I consider between A E, the West by North, and A D the West South-west, is three Points of the Compasse, that is, 33 deg. 45 min. which is the angle at A: also between E A, the East by South, and E D the South-east by East are two Points, that is, 32 deg. 30 min.

Therefore by the 8th Case of plain triangles.

As sine the angle at the point seen, $\angle E 22^{\circ} 30' \text{ m. co. ar. } 0,4176$

Is to the distance run,

A D 18 miles, 1,25527

So sine the angle at the first

place of obseruation, $\angle A 33^{\circ} 45' \text{ min. } 9,74474$

To the distance of the point seen, E D 28 $\frac{1}{2}$ miles, 1,41774

Whereby it appears, that the distance of the point seen from the place of your last obseruation is 26 miles, and a furlong. In like manner you may find the distance thereof from the place of your first obseruation A.

Admit the course from the Lizard to St. Maries be SW the distance $37\frac{1}{2}$ leagues. A certain ship bound from the Lizard to St. Maries, steers away S S W, and afterwards W by S, and so sometimes upon one of these points, sometimes upon the other, till she arrives at St. Maries, now I demand how many leagues she hath sailed upon one of these points, and how many upon the other.

Let

Let A be the Lizard, E. St. Maries, and seeing ss^w , being
 om South-west two points, makes an angle therewith of 22°
 $g. 30 \text{ min.}$ which let be A; also west by south makes with ss^w
 an angle of $33 \text{ deg. } 45 \text{ min.}$ which let be E, also South ss^w ,
 makes with west by south an angle of $56 \text{ deg. } 15 \text{ min.}$ which let
 be the complement of D to 180 degrees.

Therefore by the 8 Case.

the sine of	D, $56 \text{ deg. } 15 \text{ min.}$ com. ar.	0, 08015
to the distance given	AE, $373 \frac{1}{2}$ leagues.	2, 55113
is the sine of	E, $33 \text{ deg. } 45 \text{ min.}$	7, 74474
to	AD, $248 \frac{1}{2}$ leagues.	2, 39602

Which is the distance run upon the West by South-points,

Again,

the sine of	D, $56 \text{ deg. } 15 \text{ min.}$ com. ar.	0, 08015
to the distance given	AE, $373 \frac{1}{2}$ leagues	2, 55113
is the sine of	A, $2 \text{ deg. } 30 \text{ min.}$	0, 58284
to the way run	ED, $171 \frac{1}{2}$ leagues,	2, 23412

Which is the distance run upon the West by South Points,

o. A Merchant-man, being in the Latitude of 43°
 degrees, falls into the hands of Pirats, who amongst
 other things takes away his Sea-compass. But when
 he is gotten clear, he sails away as directly as he can,
 and after two dayes meets with a Man of War, who
 also had been the day before in the Latitude of 43°
 deg. and had sailed thence S E by S 37 leagues: He
 desirous to finde those Pirats, the Merchant-man
 tels them, he left them lying to and fro where they
 took him, and he had sailed since at least 64 leagues,
 between the South and West: what course shall the
 Man of War shape to finde these Pirats?

Let

Let A E be the Parallel of 43 deg. D the place where the ships meet: then is there given A D 64 leagues, E G 37 leagues, and the angle D E A five points of 56 deg. 15 min.

Therefore, by the 9 Case of plain triangles,

As the distance runne by	{	A D, 64 leagues,	co. ar.	8, 19381
the Merchant man,				
To sine the angle given,		E, 56 deg. 15 min.		9, 91989
So is the distance runne	{	E D, 37 leagues,		1, 56810
by the main of War				
To sine an angle required,		A, 28 deg. 44.		9, 68187

That is West Southwest, 6 deg. 14 min. southerly, and so hath the Merchant sailed; therefore to return to the same place he must shape his course East Northeast, 6 deg. 14 min. Northerly.

11. There are two Ports lying NE, and NW, one of another, a ship sails from the westermost of these Ports East Southeast 47 leagues, another departing from the Eastermost Port sails 66 leagues, and there meets with the former, what course hath this second ship kept, and how far are these Ports asunder?

Let the Northeast Port be A, the Southeast E, and the place where these ships meet at D. And forasmuch as from E to A the course is Northeast, and from E to D East Southeast, therefore the angle at E, is 67 deg. 30 min. and the side E D, 66 leagues, and A D 66 leagues.

There

by the plain Sea Chart.

Therefore by the 9 case of plain triangles.

And seeing from A to E, the course is South-west, and from A to D 41 d. 08 m. more southerly; therefore the course from A to D, is South 3 deg. 52 min. Westerly.

Secondly, for the distance of these Ports A E, the angle at A, being 41 deg. 08 min. and the angle at E, 67 deg. 30 min. the Sum of them both is 108 deg. 38 min. which subtracted from 180 deg. leaves the angle at D, 71 deg. 32 min.

Therefore by the 8 case of plain triangles.

As sine E, 67 deg. 30 min. co. ar.	8, 18046	So that the di-
As sine A, 41 deg. 08 min. co. ar.	9, 96561	stance betwene
As sine D, 71 deg. 32 min.	7, 67210	the two Ports is
As sine A E, 67 $\frac{1}{2}$ leagues,	9, 81817	67 $\frac{1}{2}$ leagues.
	1, 83051	

Some may think it requisite, that the latter part of this Problem should have been a distinct case in plain Triangles; but because the same things are here given as in the 9 Case, and the operation manifest by the Eighth & Ninth, I thought it not necessary to make another Case of it.

2. *Coasting along towards the evening, I have sight of a Cape or Headland, beyond which I desire to steer in, the next morning it bears from me S S E, and is distant by estimation 11 leagues, but I steer away South, till two of the clock in the morning about 12 leagues; and then would know how the Cape bears from me, and how far it is off?*

As admit A, I observe the Cape D to bear from the South southeast 11 leagues; but I steer away South, to E 12 leagues. have then A D 11 leagues, A E 12 leagues, the angle at A 2 deg. 30 min. (as for example) in the fore-going type.

First,

First, then for the angle at E by the 10 Case.

$AAE + AD$ 23 leagues, com. ar. 8, 6381

To AE — AD , 01 league,

So $\frac{1}{2}E + D$ 78 deg. 45. min. 10, 7017

Totang. an angle F, 12 deg. 20 min.

9, 3396

Which subtracted }
there remains } E , 66 deg. 25 min.

In working this example: because the angle given A , is 12 deg. 30 min. therefore the other two E and D , are 150 deg. 30 min. (by the first Lemma of the third Chapter of plain triangles) the half whereof is 78 deg. 45 min. Whereby we find an angle F, 12 deg. 20 min. which subtracted from 78 deg. 45 min. there remains the angle at E, 66 deg. 25 min. Wherefore seeing $E A$ is a North line, $E D$ is almost East North-east, namely, East North-east 1 deg. 5 min. Northerly.

217, for the distance of the Cape ED , by the 8 Case.

As sine the angle found, E 66 d. 25 m. co. ar. 9, 0378

To the distance in the evening; AD 11 leagues; 1, 0413

So the sine of the angle given, A 22 d. 30 min, 9, 5028

To the distance in the morning, ED 4 $\frac{1}{2}$ leagues, 06621

That is above 4 leagues and a half distant.

13. Admit I sail away from a certain port S. S. W. 50 leagues, and thence again W. by S. 30 leagues, upon what point have I made my way good, and how far am I come from a port?

As admit I sail from A to D South Southwest 50 leagues, and from D to E , West by South 30 leagues, there is required the course A , or E , and AE .

From the South Southwest to the West by South, are 5 points, that is 56 deg. 15 min. which is the complement of the angle at D , to 180 deg. So that the angle at D is 123 deg. 45 min. Wherefore here are given the two sides AD and ED , and their contained angle at D ; Therefore —

$AD + ED$, 80 leagues,	co. ar.	8, 09692
AD — 20 leagues,		1, 30103
$\frac{1}{2}(A + E)$: 28 deg. 08 min.		9, 72810
$\pm F$, 07 deg. 37 min.		9, 12004

which subtracted }
there remains } A 20 deg. 31 min.

Wherefore seeing the course from A to D , is South Southwest
the course from A to E , is 20 deg. 31 min. more westerly than
Southwest, 2 deg. southerly; so that I have made my way
Southwest two deg. southerly.

Secondly, for the distance upon that Point.

finet he angle found, $\pm A$ 20 deg. 31 min.	co. ar.	0, 45534
his opposite side given, ED , 30 leagues,		8, 47712
fine the angle given, $\pm D$, 56 deg. 15 min.		9, 91985
to his opposite side required, AE , 71 $\frac{1}{2}$ leagues,		1, 85231

Which is the distance from that Port.

There are two Ports in one and the same Parallels
or Latitude, distant 64 leagues, and there is a cer-
tain Island more southerly, distant from the Easter-
most of these ports 47 leagues, and from the Wester-
most of them 34 leagues: I demand the course from
the Eastermost port to that Island?

Let the Easter-
most port be A , the
westernmost E , both
one and the same
parallel AE , distant
64 leagues, and let
the Island be D , di-
stant from A , 47

leagues, and from E 34 leagues; there is required, the course
from A to D , that is, the angle at A , or the complement
thereof.

By the 12 case of plain Triangles.

As the distance of the parts A E, 64 leagues. co. ar. 8, 19

To the sum of A D, and E D, 81 leagues, 1, 98

So is the difference of A D, and E D, 13 leagues, 1, 17

To a certain line A, $16 \frac{414}{1096}$ 1, 18

which added to A E, is $80 \frac{454}{1096}$

The half whereof is AB, $40 \frac{227}{1096}$

Then by the 6 case of plain Triangles.

As A D 47 leagues; compl. arith. 8, 32

To Radius; 1, 60

So A B, $40 \frac{227}{1096}$ 9, 93

To s c A, s 58 deg. 51 min.

That is south west and by west 2 deg. 36 min. westerly, which is the course from the Eastermost port to the Island.

15. A ship sails from one Port to a second S S E leagues, and from thence to a third 54 leagues, and from that third to the first 85 leagues: I demand the course from the second Port to the third, and from the third to the first?

This and the like are to be wrought as the former, which therefore we leave to your own practice.

Of Sayling by MERCATORS Chart

AND thus much of the plain Chart, which as it hath commodity, that it is most easie; so it hath some inconvenience intollerable. For there be very few places that therein be expressed, according to the true Situation and distance one from another. Which as it is a great impediment to the practice of Navigation; so it hath caused much con-

in the *Geographical*, and *Hydrographical* descriptions of places; insomuch as there are scarce extant any Descriptions of the world or the parts thereof, that are not pestered with notorious Errors: the greatest part of them hence arising. It is indeed ancient, and till the Sea-Compass was known, it was the aptest Chart that could be used; because till then, men were Coasters, and for the most part returned back the same way they went forth, and it may still serve without any great error in such places as are neer the Equinoctial; also in many other places for short Voyages, and even for long Voyages, provided that a man be sure to return the same way that he went, or neer the same. Otherwise, if he trust to the plain Chart, he will be most grossely deceived many times in his course a Point or two of his Compass, and in his Distance many hundred miles. But in this Sea-Chart called *Mercators*, all or any parts of the World may be set down, according to their Longitudes, Latitudes, Courses and Distances, as truly and more conveniently for the Mariners use, than upon the globe it self: So that it will truly shew the direction and distance from place to place, which way soever a man goes or returns.

Some men will say, that in divers reckonings by *Mercators* Chart, they have found as little certainty, as by the plain Chart. Which I deny not, but the reason is, because there are few or no Charts made directly according to this Projection: it will be said, Yea, there be many; and that a man may have of them whensoever he will bespeak them. I grant a man may have those which are so called, but that which is such indeed, must not onely have the Meridians, Parallels, and Rumbes drawn according to this Projection; but the Sea-coasts must be inserted by the like Art and mean, as they have formerly been inserted into the common Sea-Chart: otherwise, he that shall transfer places out of the common Sea-Chart into *Mercators*, without due knowledge and respect upon what occasion, or for what reason they were so placed in the common Sea-Chart; he shall transfer the errors of the one into the other, and that sometimes with increase. Wherefore it requires
more

more than an ordinary judgement; to draw a Plot directly according to this Projection, for any place or places; and must further know, or be made acquainted with the reckoning of Mariners frequenting those places; and that truly whether with allowance or without, and whether agreeing or disagreeing with their plots, and so comparing one thing with another; and weighing all in the balance of a good judgement, shall be able to do it. The ground of the Projection of this kinde of Charts was pointed at by *Ptolomy*, many hundred years since; and according to that ground, *Mercator* did in late years set forth an universal Map of the World: whereupon these have been called *Mercators Charts*. But the way how to describe them was first taught by that learned Navigator of our times, *Mr. Edward Wright*, in his Book of *Correction of Errours in Navigation*. From whence also the grounds and reasons of these ensuing Problemes are to be taken: and if we would be as grateful to our own Countrymen as to Strangers, I see not but we may ascribe as much to him in this, as to any other man. Now that which he hath shewed to perform by the Chart it self, we will here shew to work by the doctrine of plain Triangles, using the help of the Table of *Logarithmic Tangents*, beginning at 45 degrees 00 minutes; and so increasing upwards, accounting every 10 min. to be one degree of the Meridian line, as the Tangent of 45 deg. 30 min. to be one degree of the Meridian line, as the Tangent of 46 deg. 00 min. to be two degrees 00 minutes of the Meridian line, and so forwards, so that every minute is 10 minutes of the Meridian line, and although that these be not the same Meridional parts that are in the doctrine of Triangles; yet they proceed in the same proportion as the Sines added together do, and shall produce the same solution to every Problem of sayling by *Mercators Chart*; as the other Tables do; but because in this small Volume we have but a *Chiliad* of 1000 *Logarithmes*, I shall work by leagues, and by miles, or minutes; yet I shall resolve the same Problems of sayling by *Mercators Chart*; that are set down in the doctrine of Triangles.

Prob. 1. *To finde by these Tables what Meridional Leagues are contained in any difference of Latitude.*

TO perform this Probleme, we must take half of each of the given Latitudes, and to each half adde 45 degrees 00 min. and the Sun shall shew us the Degrees and Minutes, where we shall find the Tangent to give us the Meridional leagues from the Equinoctial to each latitude, but it shall suffice us to substract the lesser Tangent out of the greater, and to multiply the difference or remainder by 10; and to divide that Product by 376, and the quotient shall be the meridional leagues contained between the two Latitudes.

As let one Latitude be 50 deg. 00 min. the other 32 deg. 35 min. The half of 50 deg. 00 min. is 25 deg. 00 min. to which adde 45 deg. 00 min. the Sum is 70 d. 00 min. which are 43893.

The half of 32 deg. 35 min. is 16 deg. 17 min. and an half, to which adde 45 deg. 00 min. the Sum is 16 deg. 17 min. 32 where we must look the equal parts, viz. at the Tangent of 1 deg. 17 min. and a half, which are 26147. Which substract from 43893, and the remainder is 17746, which multiplied by 10; is 177460. and that divided by 376, the quotient is 472 leagues neereft, which are the meridional leagues contained between the two Latitudes, and the like is to be done for all Latitudes whatsoever.

Now although this way doth a little differ, from that way one by meridional parts; yet the difference is of no validity to breed any considerable error in the course, and so by consequence not in the distance; and therefore I desire a favourable construction of it.

Prob. 2. *The Latitudes and difference of Longitude of two places given: to find the rumb and distance.*

TO the intent the application may be the more evident, we will give examples of two places expressed in the Chart.

As admit the latitude of the Lizard to be 50 deg. 00 min. the latitude of Summer-Islands, sometimes called the Azores 32

deg. 25 min. and the difference of Longitude to be 70 deg. min. the Summer Islands being so much to the westward of the Lizard: I demand the course, and the distance from thence to the other.

As in this right angled Triangle A D B. Let A represent the Lizard, and A B the Parallel thereof, D Summer-Islands, and D B the Meridian thereof.

Then is there given D B, the difference of Latitude 17 d. 35 m. and A B the difference of Longitude 70 d. 00 m. whereby the angles and Hypothenuſal ſhould be found by the fourth and ſecond Caſes of plain Triangles. But becauſe in this kinde of Projection, the degrees of Longitude and Latitude are not equal; (except in places near the Equinoctial) the degrees of Latitude at every Parallel, exceeding the deg. of longitude, in ſuch proportion as the Equinoctial exceeds that Parallel; therefore theſe differences of Longitude and Latitude, muſt firſt be expreſſed by ſome one common meſure. And for that purpoſe ſerves the Table of Tangents, which ſheweth how many equal leagues are from the Equinoctial to every degree of Latitude: namely, of ſuch equal leagues as a degree of Longitude doth contain 20.

Wherefore multiplying 70 deg. 00 min. the difference of Longitude by 20. I have 140 for the Meridional leagues contained in the difference of Longitude; alſo (by the laſt Probleme) I find the Meridional leagues contained in the difference of Latitude to be 472, ſo that D B is 472 leagues, and A B 1400 ſuch leagues.

Therefore by the 4 Caſe of plain triangles.

As the differ. of latit. in leagues D B 472 co. with. 73260

Is in proportion to Radius :

So is the differ. of Longitude in leagues A B 1400, 31461

To the tangent of the rumb, t D 71 deg, 21 min. 1054721

Which ſheweth the courſe from the Summer-Iſlands to the Lizard

ward to the east northeast 3 deg. 52 min. easterly, or, from the Lizard to the Summer-Islands, W S W, 3 deg. 52 min. westerly.

Secondly, for the distance in the Rumb.

Reduce the difference of Latitude into leagues (multiplying the degrees by 20) and to the Product adding one third, or the minutes.

Then by the 2 Case of plain triangles.

As sine compl. the Rumb s A, 18 deg. 39 min. *co. ar.* 049514
To the difference of Latitude DB, 352 leagues, 254654
To the distance AD, 1100 leagues; 304168

And this is the distance measured in the Rumb; there is a nearer cut between these two places, whereof we shall speak hereafter in *Great Circle sayling*; which is by Segments of several Rumbs often changing the course; but here whensoever we speak of the distance of two places, we mean their distance measured in one Rumb.

Prob. 3. The Latitude of two places, and their distance given: to finde the Rumb, and difference of Longitude.

A Dmit I sail from the Lizard, being in the Latitude of 50 degrees, upon some point to the Westward 1100 leagues, and then finde my self in the Latitude of 32 deg. 15 min. I would know upon what point I have made my way good; and how much I have altered my Longitude?

The difference of Latitude DB, is 17 deg. 35 min. which reduced into leagues, is 352 leagues. (As in the foregoing type.)

As the distance sailed A D, 1100 leagues, *co. ar.* 695832
Is in proportion to Radius:

So is the difference of latitude DB, 352 leagues 254654

To sine complement the Rumb s A, 18 deg. 39 min. 9,50486

That is west southwest 3 deg. 51 min. Westerly.

Secondly, for the difference of Longitude.

Finde by the first Probleme what Meridional leagues are contained in the difference of latitude, which are here 472, then say;

As Radius

To the difference of latitude in leagues, DB, 473, 367394

So is the tangent of the rumb, \angle D, 71 deg. 21 min. 47 218

To the difference of longitude in leagues, AB, 1400 314612

Which leagues reduced into degrees, dividing them by 20, the quotient is 70 deg. the difference of Longitude required.

Prob. 4. *By the Rumb, and Latitudes of two places given, to finde their distance, and difference of Longitude.*

Admit I sail from the Lizard, being in the Latitude of 50 deg. West Southwest 3 deg. 53 min. Westerly, till I find myself in the Latitude of 32 deg. 25 min: I demand how far I have sailed, and how much I have altered my Longitude?

The distance is found as in the latter part of the second Probleme thus. The difference of Latitude converted into leagues is 352. Say then,

As sine complen. the rumb, \angle A 18 deg. 39. min. 0, 49510

To the difference of Latitude DB 352 leagues. 25165

So is Radius,

To the distance AD, 1100 leagues, 30416

And so much is the distance: the difference of Longitude may be found as in the latter part of the 3 Probleme, saying,

As Radius, to the difference of Latitude in meridional leagues; so is the tangent of the Rumb, to the difference of Longitude in leagues.

Prob. 5. *By the difference of Longitude, Rumb, and one Latitude: to finde the other Latitude and the distance?*

Admit I sail from the Lizard, being in the Latitude of 50 deg. West Southwest 3 deg. Westerly, till I have altered my Longitude 75 deg. how much have I laid the Pole, and how far am I from the Lizard?

Reduc

Reduce the difference of Longitude into leagues by 20; and so it makes 1400; then say,

As the tangent of the rumb $D 71^{\circ} d. 31 m. co. ar. 9,52829$

To the difference of Longitude in leagues, $AB, 1400. 314162$

So is Radius,

To the difference of Latitude in leagues, $DB, 472. 267441$

Which 472 leagues multiplied by 376, and the Product

177472, and that divide by 10, and the quotient is 17747.

Which I subtract from the equal parts of the Latitude of 39

deg 00 min. which we found by the Probleme to be at the

tangent of 70 deg. 00 min, viz. 43893, and the remainder is

6146, which I seek in the tangents, and finde it the tan-

gent of $61^{\circ} d. 17 m.$ and a half, from which I subtract 45

deg. 00 min. and the remainder is 16 deg. 17 min. and a half,

which being doubled is $32^{\circ} d. 35 m.$ The Latitude of the

place to which I am come,

Secondly, for the Distance.

Having already the Rumb, and difference of Latitude, it may be found as in the second and fourth Problemes; saying,

As sine compl. the rumb, $A 18^{\circ} d. 39 m. co. ar. 0,49514$

To the difference of Latitude, $DB 352 leagues, 254654$

So is Radius,

To the distance, $AD 1100 leagues, 304168$

Prob. 6. By the Rumb, the Distance, and one Latitude given: to find the other Latitude, and the difference of Longitude?

Admit I sail West Southwest $3^{\circ} d. 51 m.$ Westerly, 1100

leagues, and then finde my self in the Latitude of $32^{\circ} d.$

$5 m.$ I demand the Latitude of the place from which I

sailed, and the difference of Longitude between that and this?

B 3

First,

First, for the difference of Latitude.

As Radius

To the distance run, A D 1100 leagues, 304168

So sine compl. the rumb \angle A, 18 deg. 39 min. 950486

To the difference of latitude, D B, 352 leagues, 254654

Which 352 leagues converted into deg. is 17 deg. 35 min. the difference of latitude required; which added to 32 deg. 15 min. makes 50 deg. 00 min. the latitude of the first place.

The difference of Longitude is found as before in the third Probleme; saying,

As Radius to the differ. in Latitude in Meridional leagues, so is the tangent of the rumb, to the difference of Longitude in leagues.

And thus the difference of Longitude will be found as in this example to be 70 deg. 00 min.

If at any time you desire to convert this difference of Longitude found in any Parallel into leagues, you may do it after this Example.

7. *Admit there be two places both in the Parallel of 50 degrees, which differ in Longitude 70 deg. 00 min. I demand the distance of these two places?*

First, it is to be understood that the leagues of Longitude in any Parallel, are not in proportion to the distance in leagues, as the Equinoctial is to that Parallel; or as the semidiameter of the one, is to the semidiameter of the other.

That is,

As Radius is in proportion,

To sine compl. the latitude, \angle C 50 deg. 00 min. 980807

So is difference of longitude, 1480 leagues, 314612

To the distance in that parallel, 900 leagues, 295415

Propositions in *Astronomy* and
Navigation, performed by the
 Tables of Artificial Sines, Tan-
 gents, and Logarithmes.

Prop. 1. *The Suns place being known, to finde his Declination.*

As Radius 10, the Sine of greatest declination, 23 deg. 30 min. so is the Sine of the Suns distance from the next Equinoctial point, to the sine of his present declination.

So the Sun being in 20 deg. 36 minutes of *Taurus*, his declination will be found to be 17 deg. 58 min. almost,

Prop. 2. *The Suns declination being given, to finde his place in the Zodiack.*

As the sine of the greatest declination is to Radius, so is the present declination to the present place.

So the Sun having 17 deg. 58 min. of North declination, his place will be found to be in 20 d. 36 m. of *Taurus*, or 9 d. 24 m.

Prop. 3. *The Latitude of the place, and declination of the Sun given, to finde his Amplitude.*

As the Co-sine of the Latitude is to Radius, so the sine of the declination, to the sine of the amplitude.

So the Sun having 11 d. 48 m. of North declination, his amplitude will be found to be 19 d. 15 m. North 215: For this is general, that if the Sun be in Northern Signs, as in *Aries, Taurus, Gemini, Cancer, Leo, Virgo*, he hath North declination,

North amplitude. And if in Southern Signes, as in *Libra*, *Scorpio*, *Sagittarius*, *Capricorn*, *Pisces*, or *Aquarius*, South declination and South amplitude.

Op. 4. *The Suns declination and amplitude given, to finde the height of the Pole.*

Set the sine of the amplitude, to the sine of the declination; so Radius to the Co-sine of the latitude.

So the declination being 11 deg. 43 min. and the amplitude deg. 7 min. the height of the Equinoctial will be found to be 38 deg. 19 min. whose complement 51 deg. 41 min. is the height of the Pole.

Op. 5. *The latitude of the place, and declination of the Sun given, to finde his right ascension.*

Set Radius to the tangent of the Suns distance from the next Equinoctial point, so is the Co-sine of the greatest declination to the tangent of the right ascension.

So the Sun being in 10 deg. of *Taurus* (that is 50 deg. from the next Equinoctial point *Aries*) his right ascension will be found to be 47 deg. 32 min.

Op. 6. *The latitude of the place, and declination of the Sun given, to finde the ascensional difference, which is the time of the Suns rising or setting.*

Set the Co-tangent of the latitude, to the tangent of the declination; so is Radius to the sine of the ascensional difference.

So the latitude being 51 deg. 30 min. North, and the declination 20 deg. the difference of ascension will be found to be 14 deg. 14 min. which reduced into time (by allowing 15 deg. for one hour, and four minutes of time for one-degree) doth amount to one hour, and almost 49 min. for the difference between the Suns rising or setting, before or after the hour of six, according

ding to the time of the year, that is, when the Sun is in Northern signes the Sun rises before, and sets after six, and in Southern signes he rises after, and sets before six,

Prop. 7. *The amplitude, and difference of ascension the Sun, or Star given, to finde his declination.*

As the sine of the ascensional difference is to the Co-sine of the amplitude, so is the Radius to the Co-sine of the declination,

So the ascensional difference being 27 deg. 34 min. the Sun rises at 4 a clock and 10 min. which converted into degrees makes 62 deg. 30 min. and the amplitude 33 deg. 38 min.

The declination will be found to be 20 deg. 10 min.

Prop. 8. *The latitude and declination given, to finde the Meridian altitude.*

If the Sun have North declination, adde the complement of the latitude to the declination, the Sum is the Meridian altitude: But if the Sun have South declination, subtract the declination from the complement of the latitude, the residue is the Meridian altitude.

So the latitude being 51 deg. 46 min. the complement thereof is 38 deg. 20 min. and let the declination be 23 deg. 30 min. North: Adde 38 deg. 20 min. to 23 deg. 30 min. the Sum is 61 deg. 50 min. the Meridian altitude. But if the declination had been 23 deg. 30 min. South, subtract 23 deg. 30 min. from 38 deg. 20 min. the remain would be 14 deg. 50 min. for the Meridian altitude.

Prop. 9. *The latitude and declination known, to finde the height of the Sun at any hour.*

As the Co-sine of the hour from the Meridian, is to Radius, so the tangent of the latitude, to the tangent of a fourth

in the latitude of 51 deg. 30 min. and one hour from the
dian, (which is either 11 or 1 a clock) this fourth ark will
be found to be 52 deg. 28 min.

Then consider the declination of the Sun, and the hour pro-
posed, if the latitude and declination be alike, both North as
South, and the hour proposed be between noon and six, take
the declination out of the fourth ark, the remainder shall be a
fifth ark: — But if the hour fall between six and midnight,
and the latitude and declination be unlike (one North, the other
South) add the declination to the fourth ark, and the Sum shall
be the fifth ark, if the Sun exceed 90 deg. take it from 180 deg.
The remainder is the fifth ark. The fifth ark being found,

say,
As the sine of the fourth ark, to the sine of the latitude; so
the Co-sine of the fifth ark, to the sine of the altitude.
The latitude being 51 deg. 30 min. North, the declination
30 m. North; If it be required to finde the Suns altitude at
the morning, you shall finde it to be 27 deg. 17 min.

*p. 10. The latitude of the place, the declination of
the Sun, and the altitude of the Sun given, to finde
the Azimuth:*

Consider whether the Suns declination be North or South, so
have you his distance from the Pole, — Add the Suns
distance from the Pole, the complement of your latitude, and
complement of your altitude all three into one sum, and
half that sum, subtract the distance of the Sun from the
pole, and note the difference;

then say,

As Radius, to the Co-sine of the altitude, so the Co-sine
of the latitude to a fourth sine.

As this fourth sine is to the sine of the half sum; so is
the sine of the difference to a seventh sine; unto which se-
venth sine, if you add the sine of 90 deg. half that sum will
be the sine of an ark, whose complement being doubled is
the

the Azimuth from the North part of the Meridian.

So if the latitude be 51 deg. 30 min. North, the declination 20 deg. South, and the altitude 12 deg. the Azimuth from North part of the Meridian will be found to be 140 deg.

Prop. 11. *The latitude given, to finde how many nutes, or miles of the Equinoctial, make a degree of longitude in any Parallel.*

As the sine of 90 deg. is to the sine of 60 deg. so the Co-sine of the latitude, to the miles answerable to a degree in latitude desired,

So in the latitude of 51 deg. 40 min. 37 miles will answer one degree in the longitude.

Prop. 12. *The course and distance given, to finde difference of latitude.*

As the sine of 90 deg. to the Logarithm of the miles run, so the sine of the courses distance from East or West, to the difference of latitude.

So if the course be West S. W. (which is 22 deg. 30 min. from the West) the miles 225, the difference of latitude will be found to be 1 deg. 26 min.

Prop. 13. *The course and distance given, to finde difference of longitude.*

As the sine of 90 deg. is to the miles run, so is the sine of the course from South to North, to the miles you are departed from your first Meridian.

So if the course be N. W. by N. (which is 33 deg. 45 min. from the North) the miles run 180, the number of miles which are departed from the Meridian will be found to be 100, which if you divide by the number of miles answerable to a degree of longitude in the latitude, you then finde your self to be; the quotient gives you the degrees and minutes of difference of longitude.

p. 14. *The distance and departure from the Meridian given, to finde the Course.*

the miles run, to the sine of 90, so the departure from the Meridian, to the sine of your course from North or South.

If the departure from the Meridian be 75 miles, in running 100 miles, the course steered is 30 d. which is S. W. by S. South-
W.

p. 15. *The latitude of the place, the declination and altitude of the Sun given, to finde the hour of the day.*

Take the Suns distance from the Pole, the complement of the latitude, and the complement of the altitude into one Sum, from half the sum subtract the complement of the altitude, leaving the difference ;

Then say,

As Radius, to the sine of the Suns distance from the Pole, the Co-sine of the latitude, to a fourth sine, — Then,

As this fourth sine, to the sine of the half sum, so the sine of the difference, to a seventh sine ; unto which seventh sine, if you adde the sine of 90 deg. half that sum will be the sine of an arc, whose complement doubled and converted into time, is the hour required.

So if the latitude be 51 deg. 30 min. the declination 20 deg. northward, and the altitude 12 deg. the time will be found to be 10 hours 24 min. almost.

The

*The Use of the following Tables
Questions that concern Geography*

THough there be diverse wayes to finde the distance of places, viz. by the Globe; by Maps, Geometrically. Yet the most exact of all other is by *Trigonometry*, way we will here lay down in three Propositions.

Prop. I. Two places differing only in the Latitude; to finde their distance.

In this Proposition there are two varieties, viz.

1 If the two places propounded lie under one and the same Meridian, and both of them on one side of the *Æquinoctial*, you must substract the lesser Latitude from the greater, and the remainder converted into miles (by allowing 60 miles to a degree) will be the distance required.

Example. *Vicentia* and *Augusta* lie under one and the same Meridian, and both on the North side of the *Æquinoctial*. *Vicentia* having 44 d. 55'. latitude, and *Augusta* 47 d. 41'. latitude, the difference of latitude is 2 d. 47', which converted into miles by multiplying it by 60, and adding thereto the minutes, maketh 167 miles, and that is their distance.

2 If one place lie on the North, and the other on the South side of the *Æquinoctial* (yet both under the same Meridian) must then adde both the latitudes together, and the sum converted into miles, will give their distance.

Prop. II. Two places differing only in Longitude, being given; to finde their distance.

In this Proposition also there are two varieties.

1 If the two places propounded lie under the *Æquinoctial*, then the difference of their longitudes reduced into miles (allowing 60 miles to a degree) giveth the distance of the places required.

Example. It is required to know the distance of the Island *Samatra* from the Island *S. Thoma*, (both lying under the *Æquinoctial*) the Island *Samatra*, hath long. 137 d. 10'. and the end of *S. Thoma* hath long. 33 d, 10', therefore the difference of their longitude is 104 d, which multiplied by 60, makes 12640 miles, which is the distance of the said places.

But if the two places propounded differ onely in longitude, and lie not under the *Æquinoctial*, but under some other intermediate Parallel, between the *Æquinoctial* and one of the poles, then to finde their distance, the proportion will be,

As the Radius, or 90 deg. is to the Co-sine of the common latitude;

So is the sine of half the difference of longitude, to the sine of half their distance.

Example. The Cities of *Compostella* and *Constantinople* have one latitude, viz. 43 deg. 0 min. but differ in longitude degrees, 15 minutes. The complement of their latitude is 47 degrees, and the half longitude is 21 deg. 37 min. 30 seconds; therefore the operation is thus to be framed.

The Radius or sine of 90 deg.

the Co-sine of the common latitude 47 d

the sine of the half difference of longitude 21 d, 37', 30".

the sine of half their distance

the arch 15 d, 38', being doubled, giveth 31 d, 16', which converted into miles (as before is taught) giveth 1876, which is the distance between the two places required.

III. Two places being given, which differ both in longitude and latitude, to finde their distance.

In this Proposition is contained three varieties.

If one place be under the *Æquinoctial* Circle, and the other towards either Pole, then the proportion is,

As the Radius or sine of 90 degrees

is to the Co-sine of the difference of longitude :

So is the Co-sine of the latitude given,

To the Co-sine of their distance required.

As the Radius or sine of 90 degrees

is to the Co-sine of the difference of longitude :

So is the Co-sine of the latitude given,

To the Co-sine of their distance required.

Exam. 1st.

Example. If it were required to finde the distance of Island of Sr. Thomas (which lieth directly under the Equatorial, and hath longitude 38 deg.) and the City of London (which hath 51 d 30' latitude, and 20 d. longitude) the distance will be found to be 3222 miles.

2 If both the places propounded be without the *Aequial*, and on the Northern or Southern side thereof, the proportion must be wrought at two operations, and because there is some difficulty therein, we have added the following figure, which will make it perspicuous to the meanest capacity.

Let D represent *London*, whose latitude is

FD 51 deg. 30 min.

and longitude 20 de-

grees no minutes, and

let O represent *Jerusa-*

lem, whose latitude

MO is 31 degr. 40
min. and longitude 66

min. and longitude 69
degr. which being

known, you have gi-

you (1) the side B.D.

the complement of the

the side B O, the comp

degrees, 20 min. (3)

the difference of long

find the side DB.

I As the Radius B

To the Co-fine of

So is the Tangent

I As the Radius BM 90 degrees,	10,000
To the Co-sine of DB O 44 deg.	9,848
So is the Tangent of DB 38 deg. 30'	9,900
To the Tangent of B P 18 deg. 55'	9,741

Which being subtracted from BO 58 deg. 20 min. remaineth OP, 29 deg. 24 min. then say,

Propositions Geographical.

31

As the Co-sine of B P 51 d. 1 min.

9,941,618

To the Co-sine of P O 60 d. 35'

9,940,535

So is the Co-sine of D B 51 d. 30'

9,893,443

To the Co-sine of D O 51 d. 51'

19,833,5978

9,891,4290

whose complement is 38 deg. 5', which converted into miles before is taught, *secit* 2331 miles and such is the distance required.

If the two places propounded differ both in longitude and latitude, and be both of them without the Equinoctial, and one of them towards the North, and the other toward the South pole, then the proportion is;

1 As the Radius is to the Co-sine of the difference of longitude,

so is the Co-tangent of one of the latitudes, to the Tangent of another ark,

Which being subtracted out of the other latitude, and 90 d. added thereto, Say

2 As the Co-sine of the ark found, is to the Co-sine of the ark remaining,

So is the Co-sine of the latitude first taken, to the Co-sine of the distance.

These are all the varieties that can possibly happen in any proposition concerning the distance of places, and is the exactest that can be invented, provided the longitude and latitude truly given.

*The use of the Tables of the Sun and Stars
Right Ascension.*

AT the end of this Book, you have two Tables; the one shewing the right ascension of the sun every day in the year, the other sheweth the right ascension, and declination of certain of the most eminent fixed stars, I will in this place shew how by the joynt use of these two Tables, any star mentioned in the Table of stars will come to the Meridian, and the rule will hold general for any star whose right ascension and declination is known. The manner of working is as followeth.

The Rule.

Subtract the right ascension of the sun from the right ascension of the star, (whose time of coming to the Meridian is required) the remainder is the time of the said stars coming to the Meridian, afternoon, but if the right ascension of the star lesse then the right ascension of the sun; adde 24 Hours therunto, and subtract the right ascension of the sun theretrom, the remainder is the time of the stars coming to the Meridian.

Example. Upon the 11th of Decem. it is required to know when the *Buls-eye* comes to the Meridian; by your Table of the suns right ascension, you find that the suns right ascension on the 11th. of December is 17 hours 59 min. and by your Table of stars you find the right ascension of the *Buls-eye* to be 4 hours 10 min. Now, (according to your rule) because the right ascension of the sun is more then the right ascension of the star, and subtraction cannot be made; you must adde 24. hours to the stars declination, so will the sum be 28 hours 10 m. from which take 17 hours 59 m. the right ascension of the sun, the remainder will be 10 hours 11 m. at which time the *Buls-eye* will come to the Meridian on the 11th. of December, after the sun, that is at 11 past 10 at night, the *Buls-eye* will be due South, the like of any other star whose right ascension is known. See the following work

Right

ascension of the sun on the 11th. of Decemb. 17 59
 ascension of the *Bul's-eye* 04 10
 hours added 24 00

the sum 28 10
 suns right ascension subtracted 17 59

remains 10 11

true time that the *Bul's-eye* will come to the Meridian.
 his Rule here deliver'd is of excellent use for Seamen,
 to find their latitude, for it is to be noted that the Rules
 which you observe for finding of your latitude by the sun, the
 same may be performed by the Stars they being upon the Meri-
 dian, as is already noted in the last Page. of my doctrine of Tri-
 angles, to which I refer you.

*altitude of any known Star being given, to find
 thereby the hour of the night.*

By the former rule find the time of the known stars coming
 to the Meridian, on the day proposed. Then seek out
 the horary distance of that star from the Meridian,
 which may be found by the same rule as you find the hour of
 day by the Sun, as is Prop. 15.

These things being found, if the star be on the East side,
 yet come to the Meridian, the difference of those two num-
 bers of hours is the hour of the night: but if the star be West-
 ward past the Meridian, the sum of those number of hours is the
 hour of the night.

Of finding the variation of the Compass.

By the third Proposition before going, you are taught to find
 the Sun's amplitude, that is, how far distant the Sun riseth or
 setteth from the true East or West points of the Horizon.

Thus if the latitude given were 51 d. 32', and the Sun's de-
 clination 17 deg. 10 min. North, the amplitude will be found

to be 24 deg. 52 min. North, because the Suns declination North.

Of the amplitude thus found there is often use made as for finding the variation of the Compass. Which is done in this manner.

Supposing the circumference or outermost edge of the scale of the Compass to be divided into 360 degrees, and the points of the needles to be placed directly under the scale, deluce, or North and South points: you are to observe the Sun-rising or setting, how many degrees the Sun is from East or West points of the Compass, which number of degrees, if they agree with the amplitude found by this point as is before shewed, and be on the same side; then hath the Compass no variation: but if they differ look how many degrees that difference is, so much is the variation.

As for example, admit I find the amplitude to be 24 deg. Northerly, then I know that the Sun should set almost 25 degrees from the West to the Northwards, but observing the Sun-setting with my Compass, admit I find it to set but 19 degrees from the West point of my Compass to the Northward, then hereby I gather that the variation of my Compass is almost 6 degrees. And thus you may find how much the variation of the Compass is. Now,

To find which way the Compass varies.

If the degree of the Compass which directly respects the Sun at his rising or setting, (namely, the degree of amplitude found as before) be more towards the right hand then the rising or setting, the variation is Easterly; but if it be more towards the left hand, the variation is Westerly. Because when a mans face is towards the North, the East is on his right hand, and the West on his left.

As in this example, I find by the amplitude, that the Sun should be set almost 25 degrees from the West point of the Compass northerly, but setting the Sun, I see that the degree of my compass is more towards the right hand than

of Sun-set, therefore, I conclude, that the variation is
 westerly.

And thus is the variation of the Compass found to be almost
 6 degrees Easterly, so that the North point of the Compass
 is not the true north, but points almost 6 degrees to the
 westward of the north, and consequently all the other points
 of the Compass direct more towards the right hand than they
 should do by almost 6 deg. And the like in all points is to be un-
 derstood if the observation had been made at sun-rising.

Note. It is fittest to make these observations when the sun
 is to be a little above the horizon, namely, when the lower
 edge of the sun seems almost to touch the horizon, for then the
 sun is in the horizon, though by reason of his refraction and pa-
 rallax he seem to be above it.

*be altitudes of any two known fixed stars taken
 when they are both in the same Azimuth, to find
 the height of the Pole.*

First, say,

the sine of the difference of the stars altitudes, is to the
 sine of the difference of their Right ascensions: To is the sine
 of the nearer stars distance from the apparent Pole, to the sine
 of the angle to be kept.

Again, Compare the furthest stars distance from the Pole
 to the distance from the Zenith, and say,

the Radius, is to the sine of the complement of the angle
 so is the tangent of the lesser of the compared arches,
 to the tangent of the first base.

Subduct the first base out of the greater of the two compared
 arches; and the remains shall be the second base.

Then lastly, say,

the sine of the complement of the first base,

to the sine of the complement of the second base:

is the sine of the complement of the lesser of the two com-
 pared arches

the sine of the height of the Pole, or latitude.

An advertisement to the Reader.

THere is lately published by Mr. Henry Phillips a Treatise, called, *The advancement of the Art of Navigation: Or, The Seamans Canon of Angles*: a Book of excellent use for all *Sea-men* whatsoever, for that by the new Tables therein contained Natural Sines, Tangents, and Secants, to any radius, cases in plain right lined triangles, may be expeditiously and exactly resolved only by looking into the Table without any calculation whatsoever, by which you may keep your account in any latitude, as well by the *Sea-Chart* as by the *Plain Chart*, and that without help of meridional parts, much better, quicker, and easier. There is also contained in the said Book variety of Examples, of all kinds, and the Tables not only applyed to the art of Navigation, but to surveying Land, in which art how necessary and useful they are leave to the judgement of those whose shall find the benefit of them in their practice. Besides, there is added to this Book a second part, shewing several ways regulating the Log-line, for the more exact finding the Ships way, with several other Instruments, and conclusions tending to the keeping of an exact account of time, with divers other things of the like concernment.

To the READER.

His Table of Artificial *Sines*, *Tangents*, and *Arithmetical Complements* of *Sines* to supply the use of *Secants*, with a *Chiliad* of one Thousand *Logarithms*, is thought fit (by Mr. *Richard Norwood*, & *Henry Bond*) to be Printed to the *Radius* 10,00000; that such as are desirous thereof may have it at a more reasonable rate, then the other larger *Tables* are at; and because it is in a more portable volume, and is of the same use that the other *Tables* are; For by these *Tables* may be resolved all plain and Spherical *Triangles*; and all *Problemes* of *Sayling*; either according to the plain *Sea-chart*, or according to *Mercators-chart* (without any other *Meridional* parts; then what are contained in these *Tables*) as it may partly appear, if you look in the latter end of the *Appendix* of the *Path-way to perfect Sayling*, now newly Printed, *Vale*;

Questions of Navigation.

Question 1. By the Rumb and distance of two places, to find the difference of latitude.

As the Radius is

To the sine of the compl. of the rumb from the merid.

So is the distance,

To the difference of latitude.

Example. If a ship sail West Northwest (that is upon the sixth rumb from the Meridian) the distance of 90 leagues: What shall be the difference of latitude?

First, If e in the Table foregoing that the angle which that rumb maketh with the meridian, is 67 deg. 30 min. the complement whereof is 22 deg. 30 min. whose sine is 38268. Therefore

As 100000 is to 38268

So is 90 to 3444 leagues the difference of latitude

or 34 ⁴⁴/₁₀₀ long.

which being multiplied by 5 the product
103 min. that is 1 deg. 43 min.

This question may also be resolved by the first Table of Rumbes where I find in the column of the sixth Rumb that 80 leagues make 1 deg. 32 m. and 10 leagues make 11 min. for the difference of latitude, which is together 1 deg. 43 min. as before.

Question 2. By the rumb and latitude of two places to find the difference of longitude.

As the Radius is

*To the tangent of the Rumb from the meridian;
So is the proper difference of latitude,*

To the difference of longitude.

Examp. If a ship sail West North-west (that is upon the sixth rumb from the meridian) as far that from the latitude of 51 d. 32' it cometh to the latitude of 49 d. 49' what difference of longitude hath such a course made?

First, I seek in the Table of meridional parts, what degrees do there answer to each latitude, and to 51 deg. 32' I find deg. 60330, and to 49 d. 49' I find deg. 57620. This being subtracted from 60330 the remainder 2710 deg. is the proper difference of latitude. The tangent of the rumb 67 deg. 30 min. is 241421. Therefore

As 100000 is to 241421,

So is 2710 to 654 d. difference of longitudes.

This may also be done by the second Table of rumbes, if you look for the longitude answering there to each latitude, and you shall find that in the column of the sixth rumb to 51 d. 32' do answer 145 d. 39' and to 49 deg. 49' 139 d. 6'. This being subtracted from 145 d. 39' the difference is 6 d. 33' which was sought for.

How to examine
the truth of any
Canon.

If to the sine of
any degree and
minute you adde
its Complement
Arithmetical, the
summe shall be
999999, or rather
1000000. Also
If to the tan-
gent of any de-
gree and minute
you adde its com-
plement, the sum
shall be 999999,
or rather 1000000
but a unites diffe-
rence in the last
place is not at all
material. By this
examination these
errors have been
discovered.

In the third de-
gree the columns
of minutes are
transposed, and,
From sine 30
deg. 30 min. to 30
deg. 60 min. for
96 read 97, &c.
